

Friesian Heritage Horse

& SPORTHORSE INTERNATIONAL

Dwarfism & Hydrocephalus are inherited genetic deformities that are prevalent in the Friesians and Friesian crosses. At this time, KFPS Approved Friesian stallions are allowed to be carriers of either one or both of these genes. A carrier parent of Friesian lineage will pass on the gene to 50% of their foals, therefore, testing is important. Foals who have two carrier parents have a one in four chance of being affected. *****Only tests conducted through FHH or FHANA / KFPS will be recognized and DNA markers must be on file.*****

Distichiasis is also an inherited genetic abnormality that affects eyelash growth and can cause damage to the eye. It is also common in the Friesian breed. Note: All hair submitted becomes the property of FHH. Test results will be disseminated at the discretion of the FHH.

Testing is simple and only requires 30-40 hairs to be removed, **by the roots**, from the mane or tail of the horse. For very young foals, it is best to pull hair from the head of the tail. A laminated copy of the results will be mailed to you.

(Recommended)-\$85-(3 tests)-Dwarfism/Hydrocephalus/Distichiasis \$65-(Any 2 tests)- Check 2 boxes below
 \$50-Dwarfism only \$50-Hydrocephalus only \$50-Distichiasis only

Place roots here

Tape Here

Place the rest of the hair here. Coil and tape if necessary.

DO NOT PUT HAIR IN A PLASTIC BAG!

If horse has previously been DNA tested through FHH, a new hair sample is probably NOT needed.

Pull from the withers, like this:

Hair sample should look something like this:
